Trade Lifecycle | Corporate Actions | Settlement | Architecture

Module Architecture Overview

The Securities module consists of 9 interconnected sub-modules. Securities Core (SC) serves as the central hub, connecting trade execution to portfolio management, corporate actions, custody, and regulatory reporting.

Workflow 1: Securities Trade Lifecycle

This workflow shows the end-to-end process from order entry through execution, matching, settlement, and final completion. Credit checks gate trade execution, and settlement involves both securities delivery and cash movement.

Figure 2: Securities Trade Lifecycle

Workflow 2: Corporate Action Processing

Corporate actions follow a structured flow from announcement through diary setup, entitlement identification, election collection (for elective events), processing, accounting entry generation, position updates, and final settlement.

Corporate Action Processing

Workflow 3: Settlement Processing Flow

Settlement begins after trade execution with instruction generation, counterparty matching, SWIFT message dispatch, DvP/FoP settlement, position and cash updates, and reconciliation. Unmatched trades remain pending until resolved.
